Titr.

The Broadcast System for Local TV

Newsroom, on-air graphics, live market data and playout behind one login, on one PC.

Presented by : **Micheal**

08. What's Next

What Titr does today, who it is for, the live market data now coming to air, and what happens before the first station goes live.

The Problem

Three machines, three logins

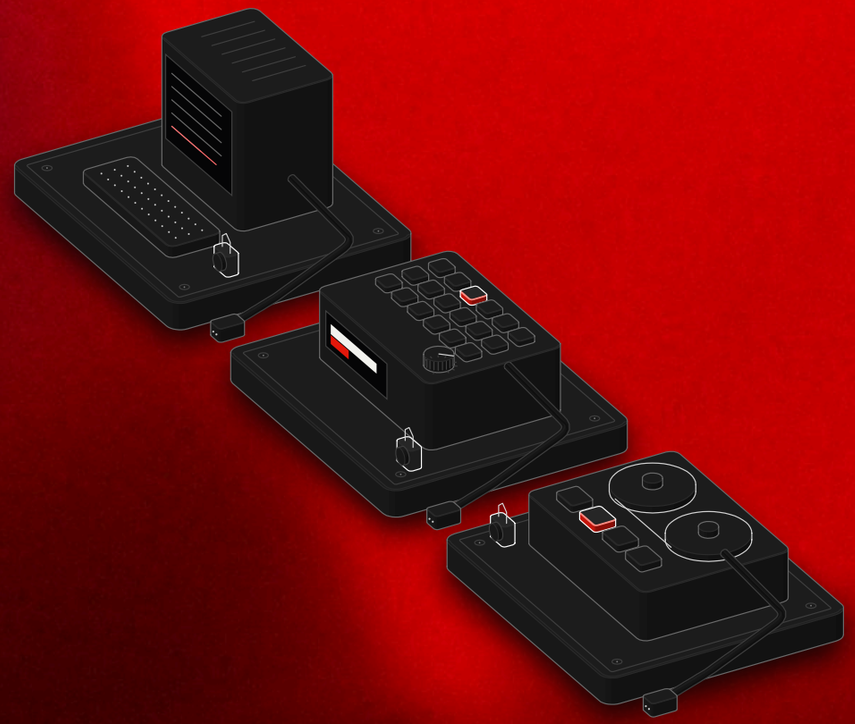

News, graphics and playout run on separate tools that never share data. Every headline is typed again at each step, and each step adds a typo.

Nothing joins them up

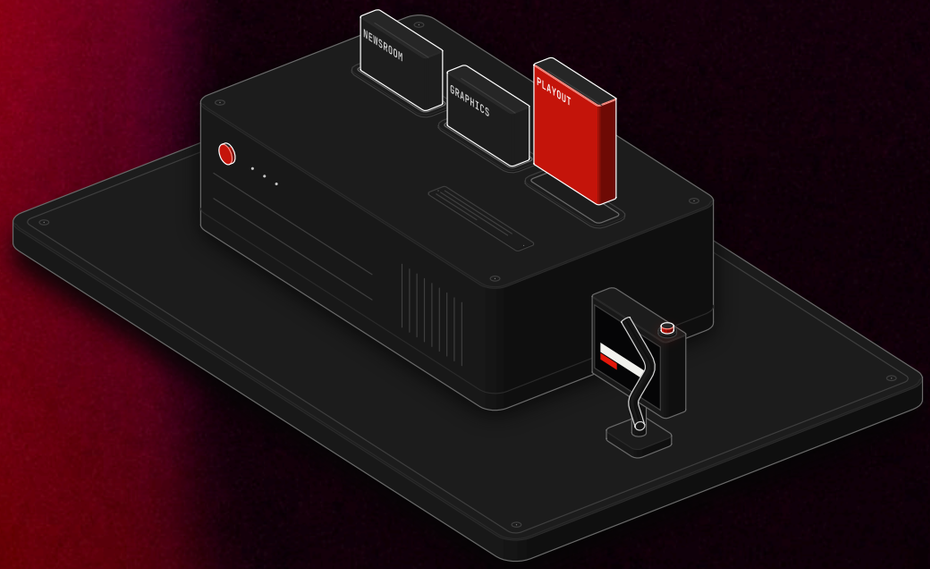

No preview, no approval and no record of who put what on air. Rates and weather are typed by hand and go stale.

Too expensive for small stations

Broadcast graphics and playout systems are priced for national networks: licences, dedicated hardware and yearly support a local station can't afford. **That is why we are building Titr.**

Our Solution

Newsroom

Journalists write headline packs. The director approves them and runs the newsroom strip, live on air.

Graphics

Cue a graphic, check it on preview, take it to program. Templates are built without code.

Playout

The CasparCG engine keys it all over video and sends one program to NDI, SDI, OBS or vMix.

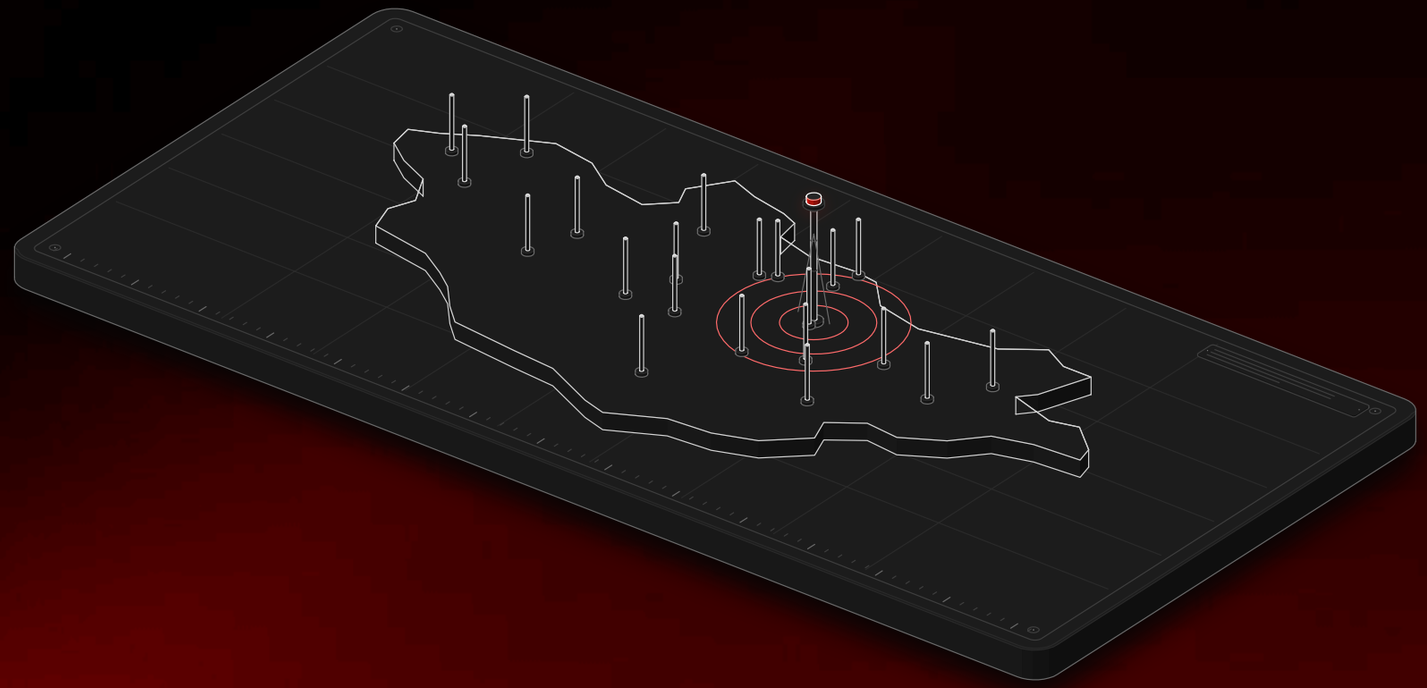

Who It's For

1 PC

Runs a whole station: newsroom, graphics and playout, with no server room, no cloud contract and no licence server.

21

Aimag centres across Mongolia, plus the capital: each with local news, local prices and weather to put on screen.

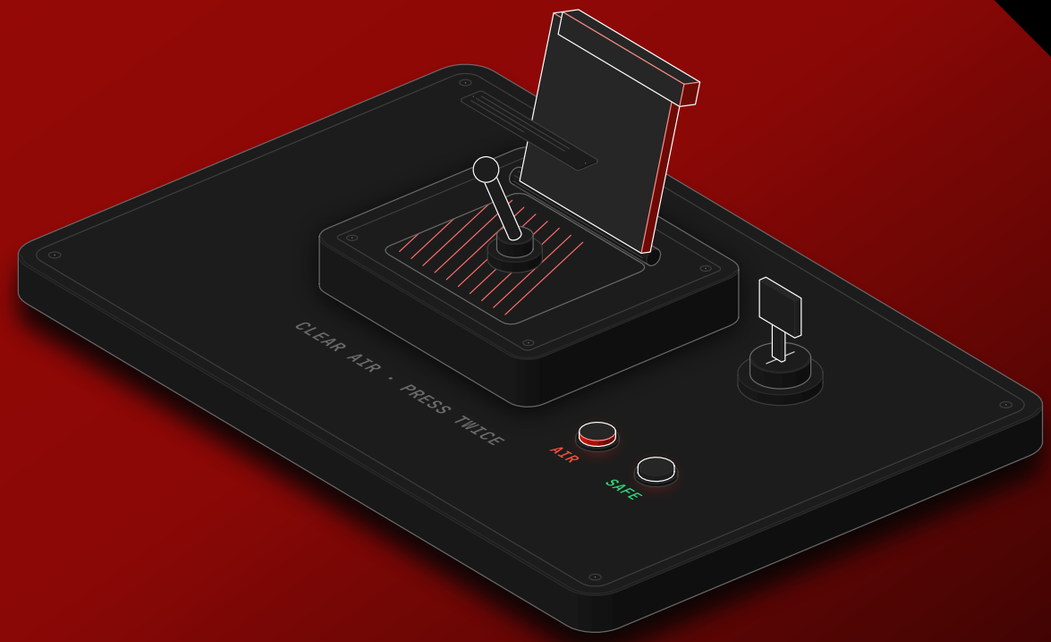

Why Titr?

Runs Offline

Fonts, templates and data live on the station PC. Losing the internet doesn't take you off air.

Safe on Air

Clear air sits under a guard and asks twice. Edits on air wait for TAKE, each role has its own key, and every take is logged.

Titr

Who Uses It

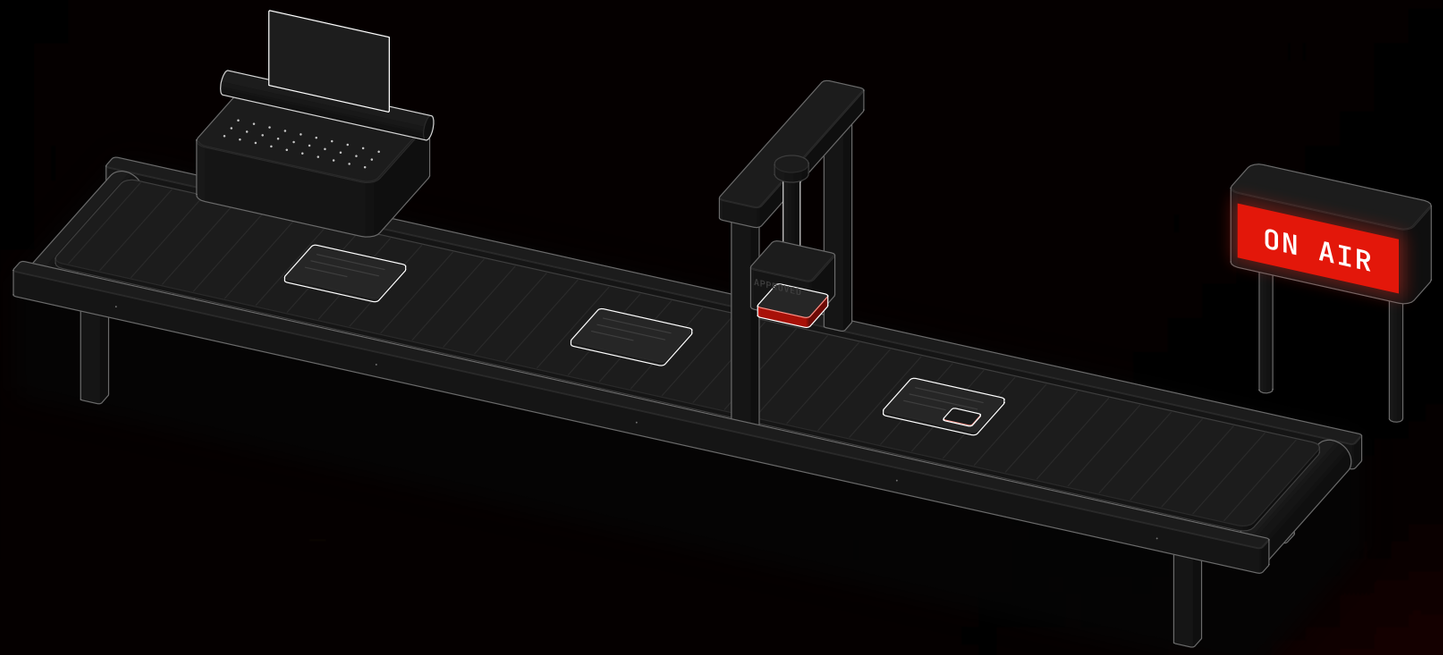

Five roles share one system. Each person gets a key, and a key opens only the rooms that job needs.

- Admin
- Director
- Producer
- Journalist
- Operator

8 rooms, one login

Titr

From Story to Air

Write · Approve · Take

A journalist types the headline pack once. The director stamps it, and it rides to the strip on air. Nothing reaches the screen without approval, and every take lands in the as-run log.

Live Market Data

Exchange rates, gold, copper and markets feed straight into the ticker and statistic cards. When a price moves, the flap on air flips with it: up in green, down in red, with no one retyping it.

Values from the app's feed on 13/11/2026; movement in the web version is a preview. Official Монголбанк rates are being connected; until then rates are marked ЖИШЭЭ on air.

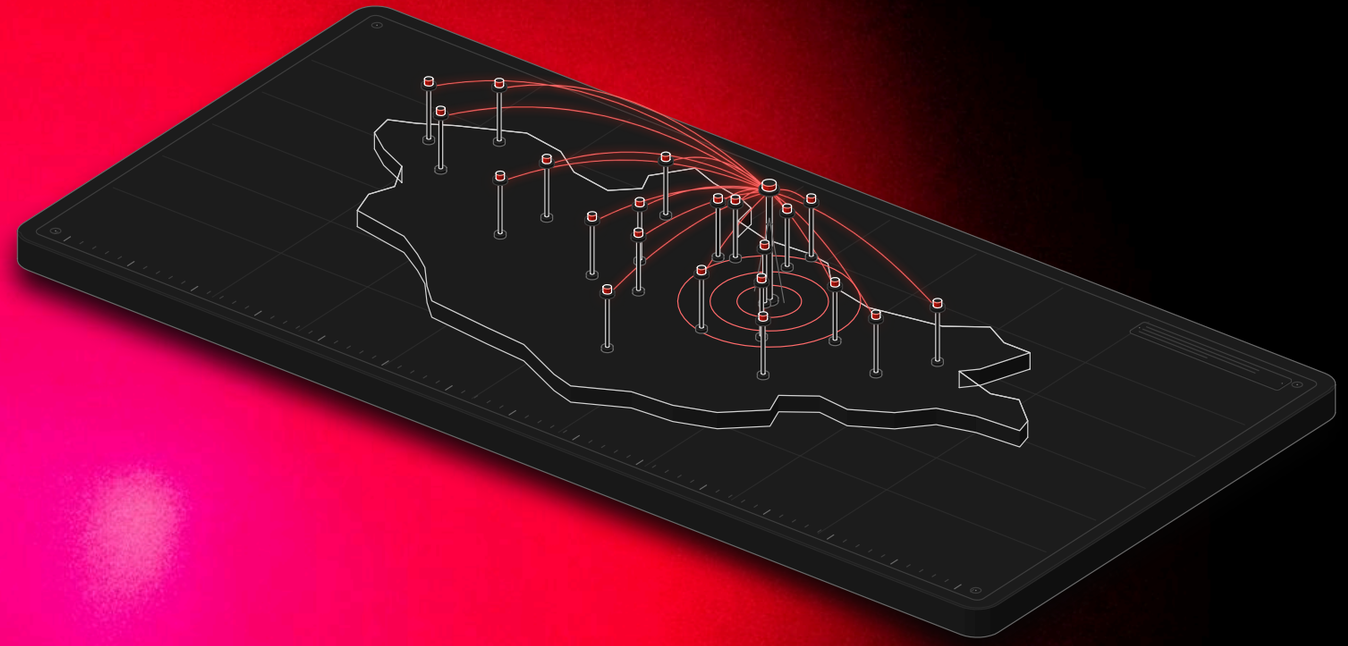

ЖИШЭЭ USD/MNT 3,607 • 0.00% EUR/MNT 4,009 • 0.00% CNY/MNT 540 • 0.00% RUB/MNT 43.6 • 0.00% KRW/MNT 2.70 • 0.00% JPY/MNT 22.

What's Next?

Titr becomes the system Mongolian TV runs on, from Ulaanbaatar to every aimag.

01. **First station on air**
SDI, the real switcher, a 72-hour soak test

02. **Every aimag on Titr**
21 regional stations on one system

03. **One national newsroom**
A story written in Ulaanbaatar airs in Khovd

04. **Live data for the country**
Монголбанк rates, weather, election night

These are plans. Today Titr runs end to end on one PC, with NDI output proven at 1080p 59.94 and no dropped frames in the test.

Thank You.
